

03 GN 50

Spectral performance data

We give curves below showing transmittance and optical density both for the visible/near visible and full range. Please note that this is only the glass manufacturer's typical data and *may vary quite significantly from actual performance outside the visible band*. The glass manufacturer only guarantees the performance at three wavelengths: 405nm, 546nm and 694nm. For more information on this guarantee please contact us.

If performance at any wavelength (including wavelengths outside the visible) is critical, please contact us to discuss your needs. We can scan material and produce filters of guaranteed performance specially to your requirements. Transmission can, of course, be controlled by accurate control of filter thickness.
